Library List No. 19 - Supplement No. 1. Washington, D. C., September 1947

THE FARMHOUSE

A List of References

Compiled by Cora L. Feldkamp

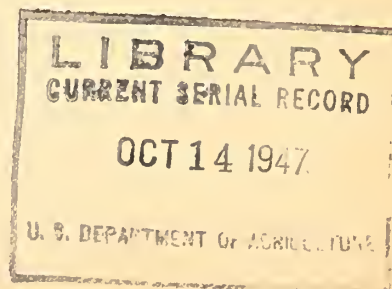

This list, which covers the period from October 1945 through July 1947, is a supplement to Library List No. 19, issued October 1945, covering the years 1938-1945, compiled by Vajen H. Fischer, and will be most useful if used with that list.

With the exception of the addition of a section on Home Furnishings, the scope and classification of the two bibliographies are practically the same.

The publications listed may, for the most part, be consulted in libraries. United States Department of Agriculture publications are available free of charge as long as the Department's supply lasts. State agricultural experiment station and extension publications are ordinarily available free of charge to residents of the respective State. Photoprint copies of material not available elsewhere may be obtained from the United States Department of Agriculture Library.

Items marked with an asterisk (*) have not been examined. Call numbers following the citations are those of the United States Department of Agriculture Library, unless otherwise stated.

The helpful suggestions of Samuel P. Lyle, Adam T. Hohman, and Mary A. Rokahr of the Extension Service are gratefully acknowledged.

 "Studies were made at Oregon State College to ascertain the effect of exposure to rains and wind on the overall heat loss from exterior building walls. Test equipment was set to simulate natural conditions. Under still air conditions the overall heat transfer coefficient U of the test wall was 0.241 Btu per (sq.ft) (hr.) (F deg.). With a 15 mph wind this was increased to 0.283. With a mph wind and the equivalent of 1/4 in. of rain per hour sweeping the outside surface, the heat transmission coefficient increased by 12.4 percent to 0.318. Variations in temperature of the rain made little variations in the heat loss."

Better planned, built, and insulated modern houses require less piping and effective radiation. As modern heating is not always continuous heating good heat controls are important. For the small home; expansion tanks should hold 20-24 gallons and large homes, 30 gallons.

A survey made by the Institute of Boiler and Radiator Manufacturers revealed that 41 percent of 1946 houses would have hot water or steam heating systems.

Gains for hot water and steam systems were shown in all areas except the New York metropolitan section. A slight trend toward warm air heating is also shown for New England and Pennsylvania due to the lower cost of installation.
